

CNR activity April-September 2020

C. Monitoring of the impact of the project actions

C.2 Monitoring and validation of the use of remediated sediments as a substrate for plant nursing and cultivation: non food crops production

C.3 Monitoring and validation of the use of remediated sediments as a substrate for nursing and cultivation: food crops production

CNR involvement: Physical, chemical and biochemical properties of the growing media

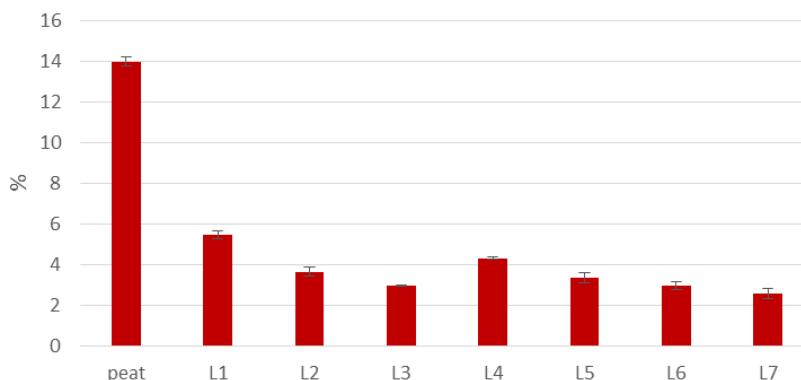

Until now:

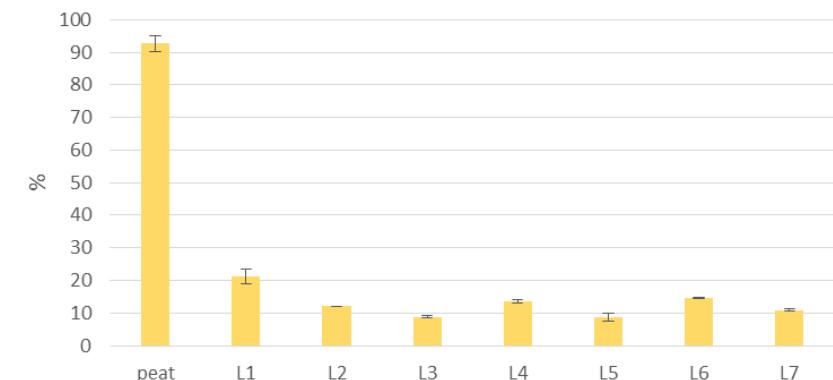

- pH, Electrical conductivity, NO₃, NH₄ = all samples
- humidity and volatile solids: Laurel, Protea, Calla
- bulk density= only in Laurel

LAUREL			
L1	60% peat	40% pumice	
L2	45% peat	30% pumice	25% sediment
L3	30% peat	20% pumice	50% sediment
L4	45% coconut	30% pumice	25% sediment
L5	30% coconut	20% pumice	50% sediment
L6	45% fibril	30% pumice	25% sediment
L7	30% fibril	20% pumice	50% sediment

Physical and chemical characteristics of an agronomic substrate (D.lgs 75/2010)

Parameter	D. lgs. 75/2010
Bulk density (g/cm ³)	<0,95
pH	4,5-8,5
Electrical conductivity (dS/m)	<1
TOC %	>4
TN %	<2,5
P ₂ O ₅ %	<1,5
Cd (mg/kg)	1,5
Cu (mg/kg)	230
Hg (mg/kg)	1,5
Ni(mg/kg)	100
Pb(mg/kg)	100
Zn (mg/kg)	500

The started substrate in line with Italian legislation

Question?
Which are the conventional substrates for these plants?

Future activities:

- Finish analyses on received samples:
 - Protea, Basil, Calla: bulk density
 - all samples: enzyme activity, TOC and TN
 - started materials: all analyses
- Receive and analyze first sampling
- Receive and analyze Spanish samples

Thanks for your attention and GOOD
WORK
